What is a battery swapping station (BSS)?

T. Kousksou Battery swapping station (BSS) also known as battery switching station is a place where electric vehicle owners can rapidly exchange their empty battery with a fully charged one (see Fig. 17). This concept has been proposed as a new method to handle the obstacles regarding to the aforementioned traditional charging methods [272, 273].

Are battery swapping stations a viable alternative to plug-in charging?

Battery swapping stations (BSS), which provide quicker energy replenishment and facilitate innovative business models like Battery-as-a-Service, have been a subject of interest as a prospective supplement to conventional plug-in charging.

How a battery swapping station works?

The charging scheduling in the battery swapping station properly assists the microgrid to reduce the exchanged power with the grid when electricity is expensive during hours like 13, 18, and 22. The received power from the grid is managed by the energy management system to be on the minimum level when electricity is expensive.

What is battery swapping operation?

The battery swapping operation is modeled by Eqs. (3.36) and (3.37). In the battery swapping operation, the fully charged battery in the station is replaced with a depleted battery of an electric vehicle which arrives at the station. At the time of battery swapping, the fully charged battery is replaced with an empty battery.

Conclusions Speed is the biggest advantage of battery swapping. The whole operation can take a few minutes, which is about the same time as it takes to fill up a vehicle with a combustion engine. Another advantage of this solution is that the owner does not have to leave the vehicle to change a battery. He does not have to touch publicly accessible wires, butt...
