---

Distributed generation (DG) in the residential and commercial buildings sectors and in the industrial sector refers to onsite, behind-the-meter energy generation.

Distributed generation refers to technologies that generate electricity at or near where it will be used. Learn about how distributed energy generation can support the delivery of clean, ...

DOE is helping policymakers, regulators, utilities, and stakeholders address challenges by coordinating best practices to enable the utilization of distributed energy resources (DERs). All of ...

Distributed generation (DG) refers to electricity generation done by small-scale energy systems installed near the energy consumer. These systems are called distributed energy resources (DERs) and ...

Distributed generation, also distributed energy, on-site generation (OSG), [1] or district/decentralized energy, is electrical generation and storage performed by a variety of small, grid -connected or ...

What are DERs? Distributed Energy Resources (DERs) are small, modular energy generation and storage technologies that provide electric capacity or energy where it is needed.

Distributed generation is the local production of electricity using solar, wind, CHP, fuel cells, and energy storage near the point of use, reducing transmission losses and improving grid resilience.

To help meet the ever-rising demand for energy in the U.S., policymakers, regulators, and utilities should look to distributed energy resources (DERs) as a bigger part of the solution.

Distributed generation (DG) is typically referred to as electricity produced closer to the point of use. It is also known as decentralized generation, on-site generation, or distributed energy - can ...

# Distributed energy generation and storage

What Are Distributed Energy Resources? Distributed Energy Resources (DERs) are energy generation and storage systems located near the point of consumption. Unlike centralized power plants, DERs ...
