-----

However, in the inverter settings the "Max Discharge Power" is set to 6 kW, and I can't change that value. Does anyone know if this 3 kW limit is normal for my configuration, or if there's ...

Just disable all export (Solar and Batteries). That way your system will run during the day, charge up your batteries to 100% and then once that happens your solar production will automatically be ...

How can I configure the system to limit the battery discharge to 60A and draw the additional power needed from the grid? Any detailed steps or settings adjustments would be greatly ...

As the week progresses and more solar energy is becoming available, notice how BatteryLife makes its system operate at or near full charge, and how it allows the depth of discharge to be increased as the ...

Currently, at the end of the day, the battery provides power for my home, until it discharges 20% (80% capacity left). I want to tune the percentage of discharge for the battery, and ...

To stay at or below the Site Import Limit, first Powerwall reduces its charge rate. If necessary, it also discharges to the system. If the Site Import Limit is 10 kW and the system is importing 8 kW, ...

The DNO agrees to a 10 kW limit for importing power and a 6 kW limit for exporting it. I'm exploring the best way to use this limit. Let's say I install a 20 kW solar panel system. I can fit this, and some ...

These regulations include limits on the amount of power that can be generated by small-scale solar photovoltaic systems to prevent damage to the network and ensure that the electricity supply ...

You batteries can discharge at a sustained maximum of 4kW each, so 12kW for a 3x8kWh stack, but this must be converted to mains voltage AC which is the function of the Sig inverter.

I don't want to limit discharge since the battery needs to be available if solar dips below the house load.

# Outdoor solar power hub limit discharge

Otherwise it starts importing from the grid.
