Power: The S.I. unit is the watt ($W = \text{kg m}^2 \text{s}^{-3} = \text{J} / \text{s}$ $W = ? =$). The watt will be used to measure power or energy-rate for all forms of energy and should be used wherever instantaneous values of energy flow ...

Our solar system includes the Sun, eight planets, five officially named dwarf planets, hundreds of moons, and thousands of asteroids and comets. Our solar system is located in the Milky ...

Our whole solar system, along with all the local stars you can see on a clear dark night, reside in one of our galaxy's spiral arms, known as the Orion arm, as they orbit the supermassive ...

As a unit of measurement, the solar mass came into use before the astronomical unit and the gravitational constant were precisely measured.

Historically, the astronomical unit was conceived as the average Earth-Sun distance (the average of Earth's aphelion and perihelion), before its modern redefinition in 2012. The astronomical unit is used ...

Solar system, assemblage consisting of the Sun and those bodies orbiting it: 8 planets with more than 400 known planetary satellites; many asteroids, some with their own satellites; comets ...

List of Solar Units: The natural units for stars are set by the Sun which is a G2 V star. These are the solar units. Of course, these units are natural only for us Earthlings since the Sun is our star. ...

The Solar System currently moves through a cloud of interstellar medium called the Local Cloud. The closest star to the Solar System, Proxima Centauri, is 269,000 AU (4.25 ly) away. Both are within the ...
