About `__func__`: "The identifier `__func__` is implicitly declared by the translator as if, immediately following the opening brace of each function definition, the declaration: `static const char ...`

Calling the function with `()` in a return statement executes the function, and returns whatever value was returned by the function. It is similar to calling `var x = b();`, but instead of assigning the return value of ...

The difference is that `functionOne` is a function expression and so only defined when that line is reached, whereas `functionTwo` is a function declaration and is defined as soon as its ...

I'm creating a Python function for a cinema that checks if a customer is eligible to view their film choice. I have included three pieces of information, which is age, film rating and ID.

509 It's all about variable scoping. Variables declared in the self executing function are, by default, only available to code within the self executing function. This allows code to be written without concern of ...

A function of that nature can be called at any time, anywhere. jQuery (a library built on Javascript) has built in functions that generally required the DOM to be fully rendered before being called.

`(function(){})(!);` Lastly, `!` makes the expression return a boolean based on the return value of the function. Usually, an immediately invoked function expression (IIFE) doesn't explicitly return ...

12 The `function*` type looks like it acts as a generator function for processes that can be iterated. C# has a feature like this using `"yield return"`; see 1 and see 2 Essentially this returns each ...
