The size of the solar system is defined by the volume of space over which the Sun's influence exceeds those of other nearby stars in the Milky Way galaxy. This influence derives from ...

Overview Definition Formation and evolution General characteristics Sun Inner Solar System Outer Solar System Trans-Neptunian region The Solar System is the gravitationally bound system of the Sun and the masses that orbit it, most prominently its eight planets, of which Earth is one. The system formed about 4.6 billion years ago when a dense region of a molecular cloud collapsed, creating the Sun and a protoplanetary disc from which the orbiting bodies assembled. Inside the Sun's core hydrogen is fused into helium for billion...

Solar system, assemblage consisting of the Sun and those bodies orbiting it: 8 planets with more than 400 known planetary satellites; many asteroids, some with their own satellites; comets ...

Natural satellites, which are commonly called "moons", can be found throughout the Solar System and in sizes from planetary-mass moons to much less massive moonlets at their smallest.

Our Solar System is staggeringly big in human terms. If you look through a small telescope at the bright shape of Saturn, you will see a planet that is well over a billion kilometres ...

There are four rocky planets and four giant planets in our solar system. The distance between the planets is large, particularly for the giant planets in our outer solar system. Even our closest cosmic ...

While Earth is only the fifth largest planet in the solar system, it is the only world in our solar system with liquid water on the surface. Just slightly larger than nearby Venus, Earth is the biggest of the four ...

Since its diameter is 11 times larger than the Earth's, this means that 1,300 Earth globes can fit into its volume. That's why it is represented by a ball the size of a pea of 7 mm. Around it, one ...

The solar tracking system is slightly larger

How big is the Solar System? Short answer: The Solar System is a disc shape, 244 astronomical units wide (244 times the distance from the Sun to the Earth, or about 36.6 billion km).

Since its diameter is 11 times larger than the Earth's, this means that 1,300 Earth globes can fit into its volume. That's why it is ...
